

## Abstract

In the temple connection structure of an eyeglass frame according to the present invention, clamp portions for spherical shafts are provided on both sides of the front frame. The ends of the temples are rotatably connected to central shafts of the spherical shafts through joint members. The clamp portions hold and fix the spherical shafts so as to be finely adjustable in any desired direction. Thus, the opening of the temples, orientation of the temples in the vertical direction, and twisting of the temples can be optimally adjustable according to the shapes and sizes of the face, nose and ears of the user.
